

My week 3 presentation is on the jQuery library Stellar.js. Since starting school at Full Sail in 2012, I have run into multiple websites with the parallax effect and have always wondered how to implement it with minimal code. There are several ways to get this effect on elements but none that I found were easier than the jQuery library Stellar.js. Being able to call the data-stellar attribute on any element without having to write tons of JavaScript is my kind of plug-in.

My experience using the plug-in was very positive and I would recommend it highly to others. There are also other possibilities for Stellar.js that didn't interest me for this project but will be looking at for future ones for sure.
